Energy Monitoring

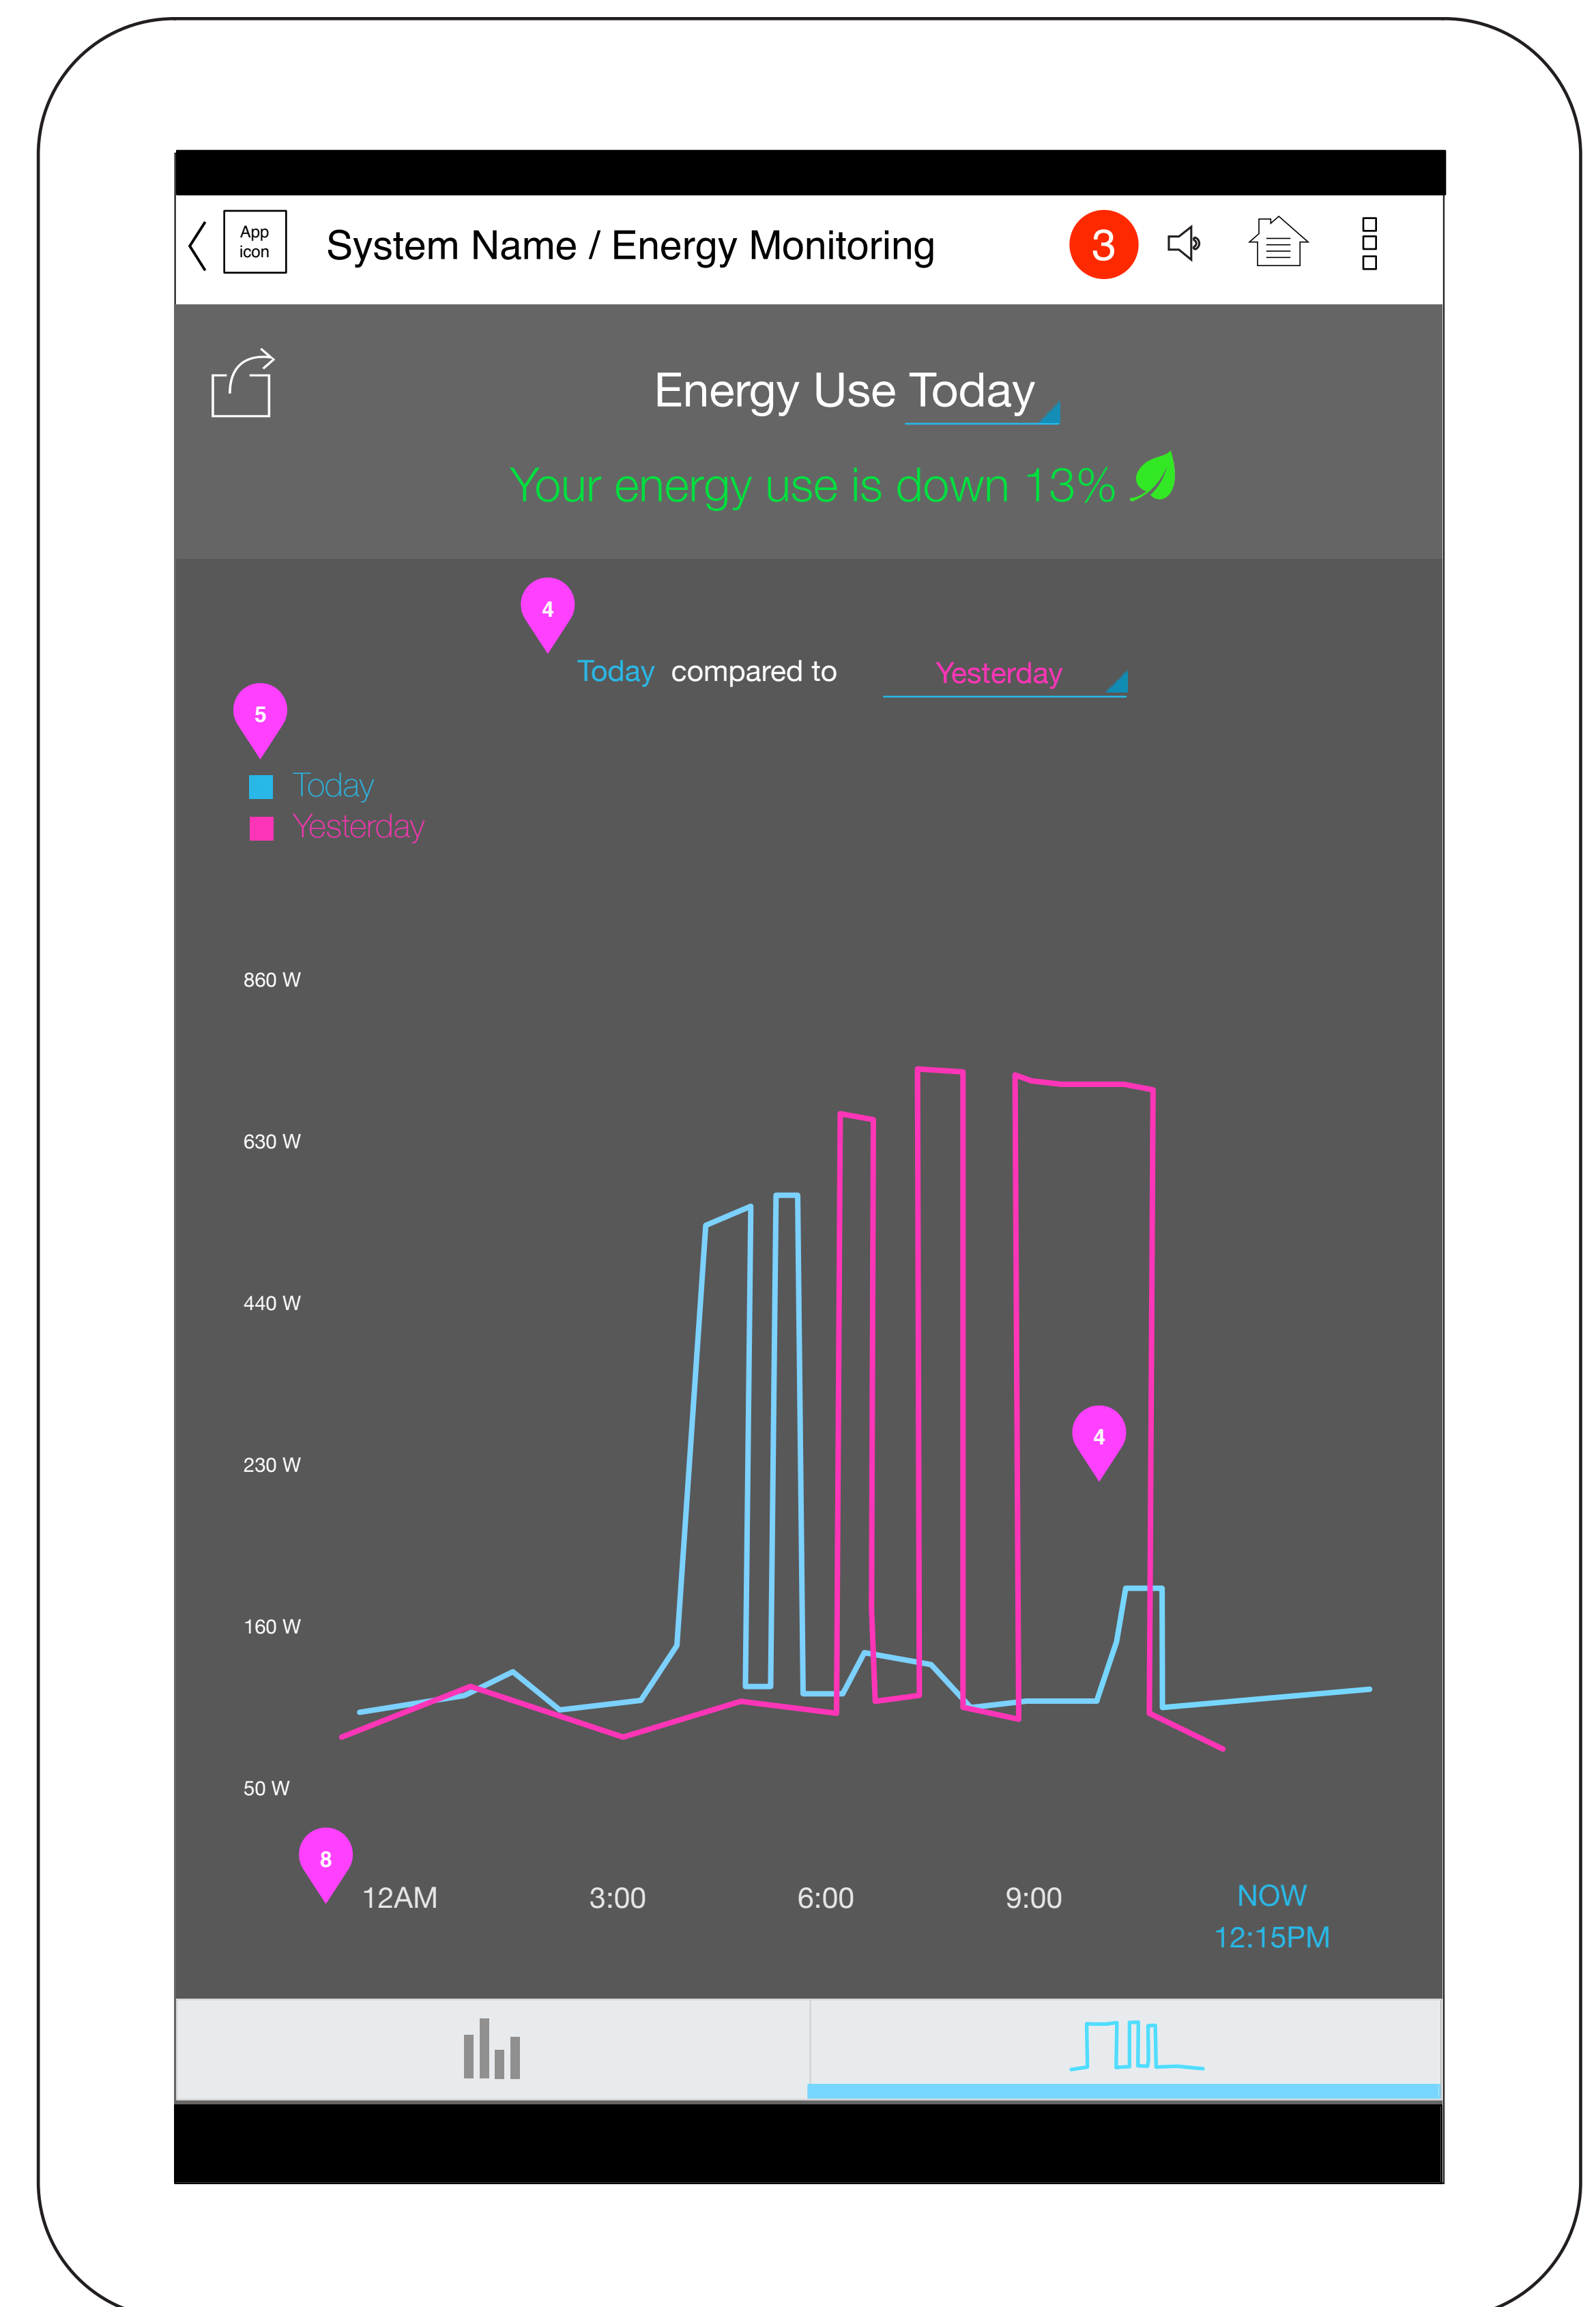

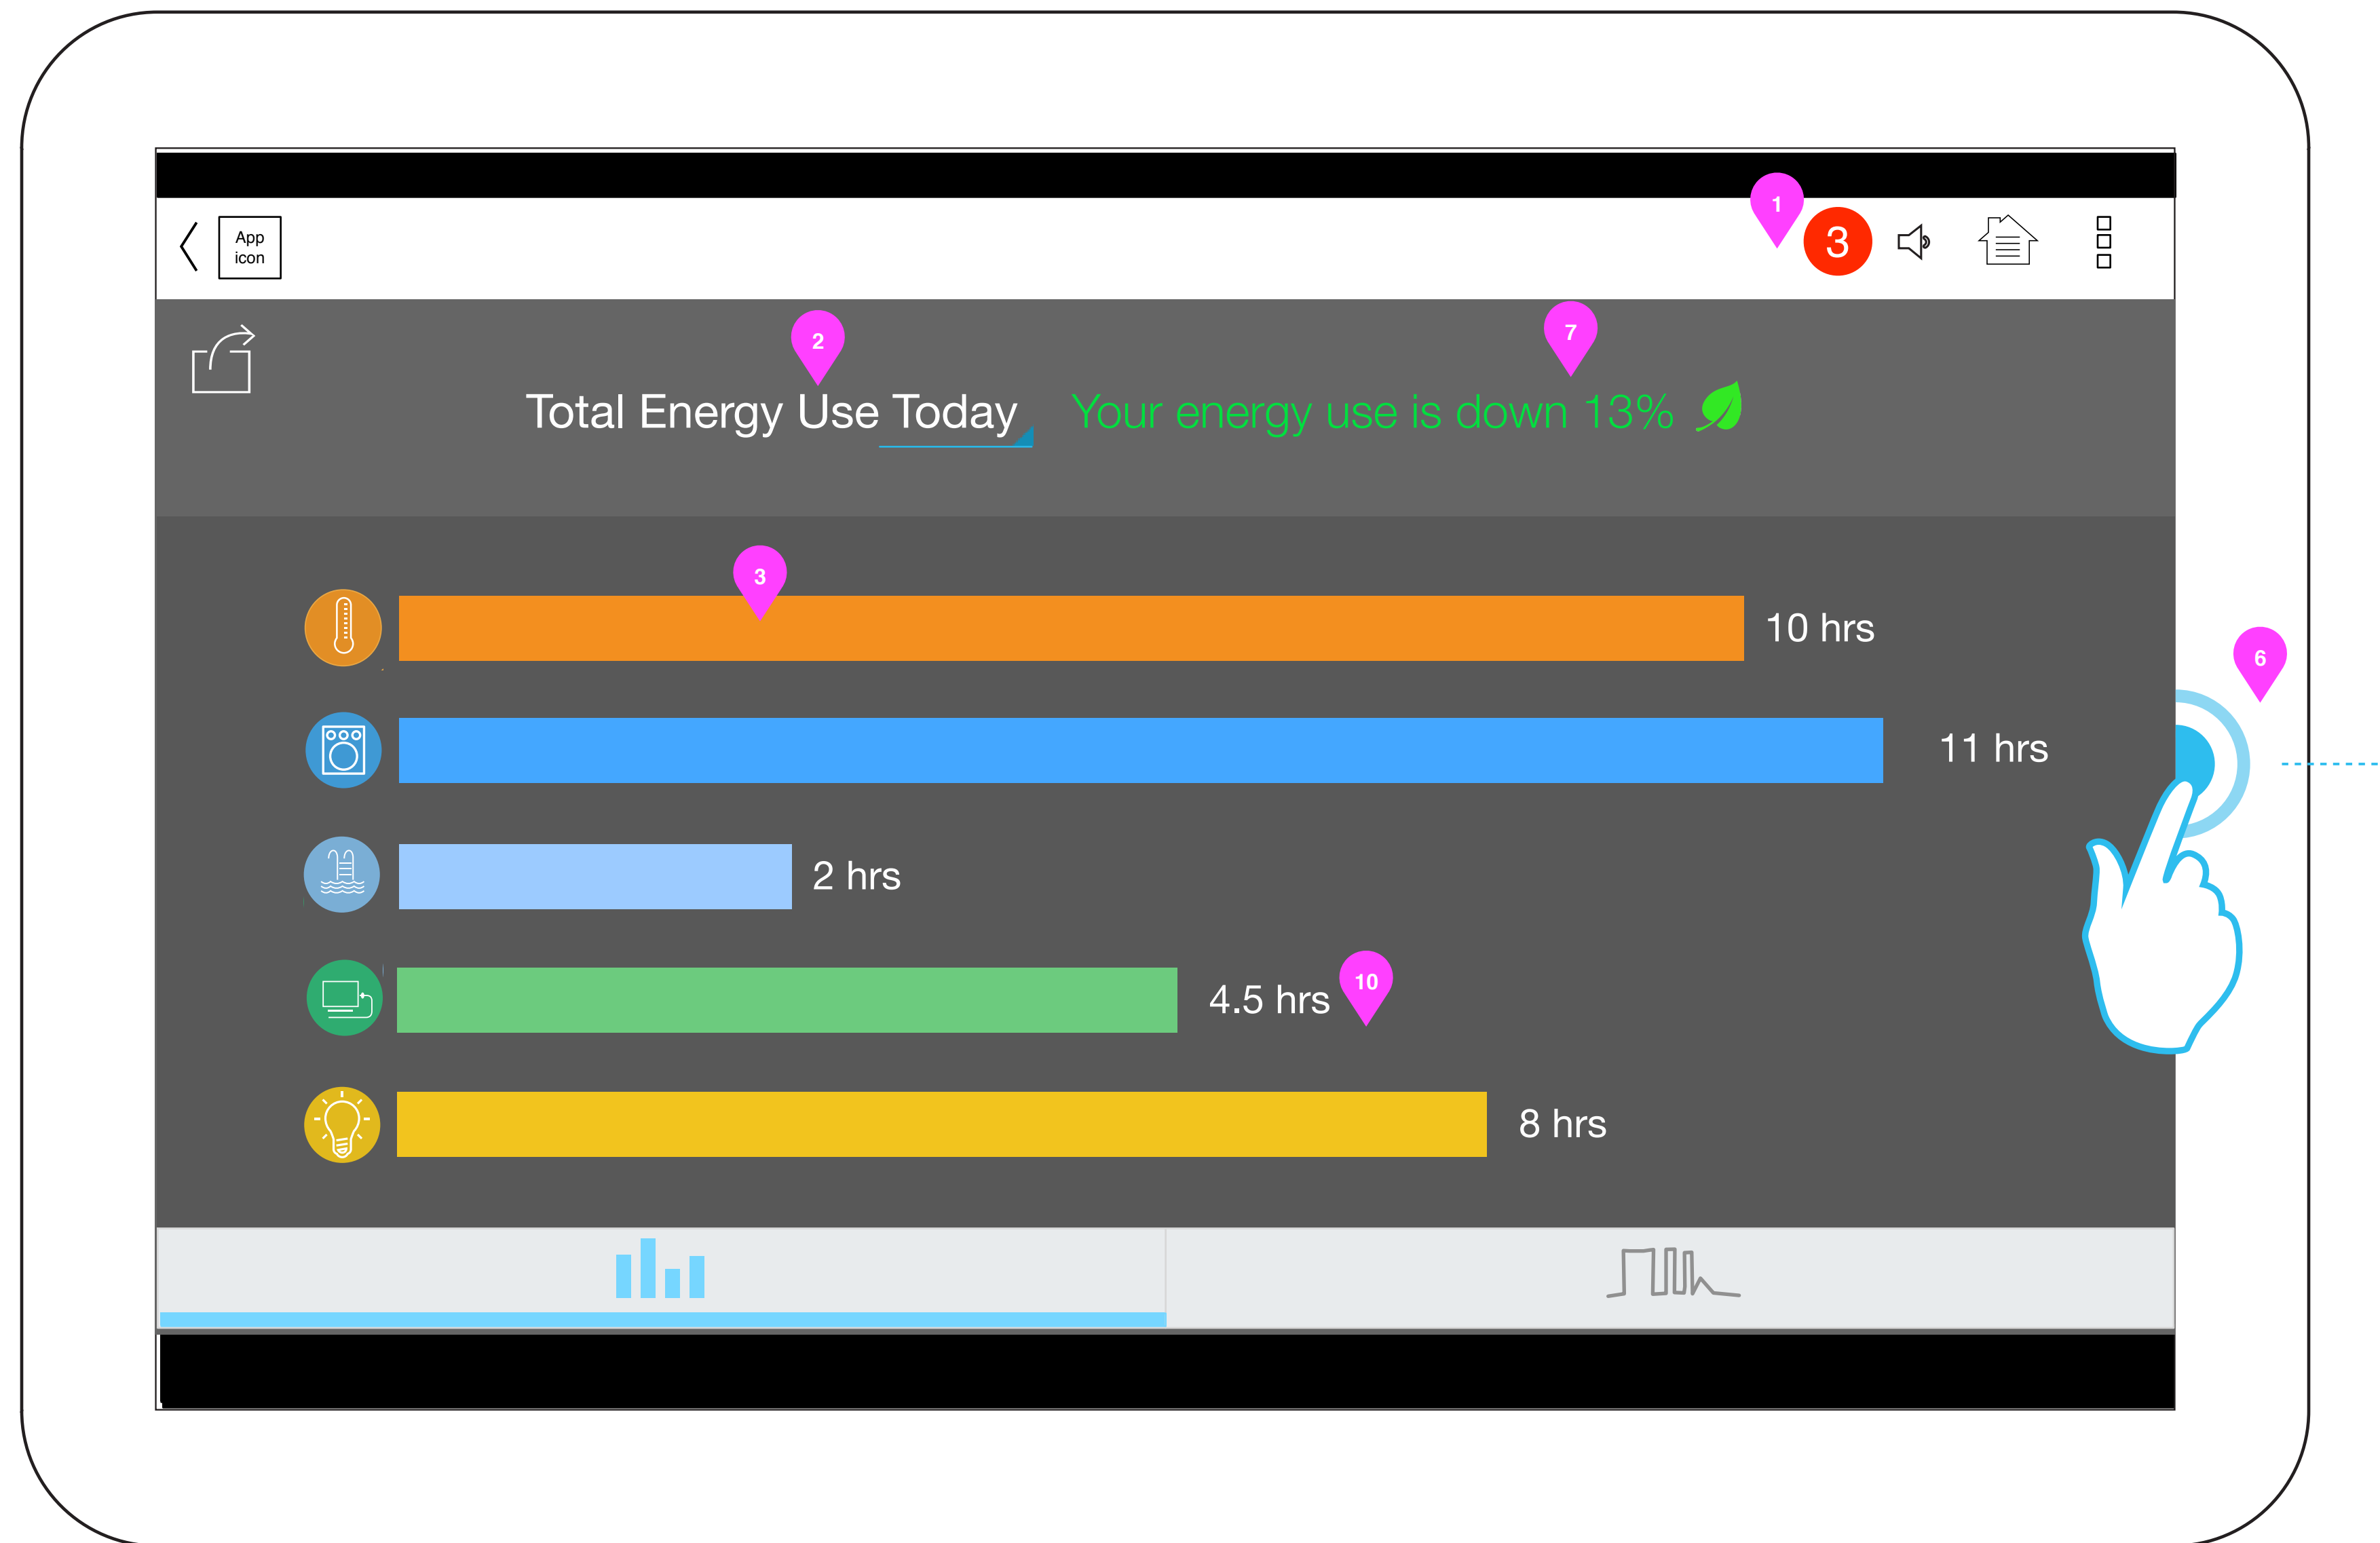

Version

Thurs. June 6, 2014

2.0

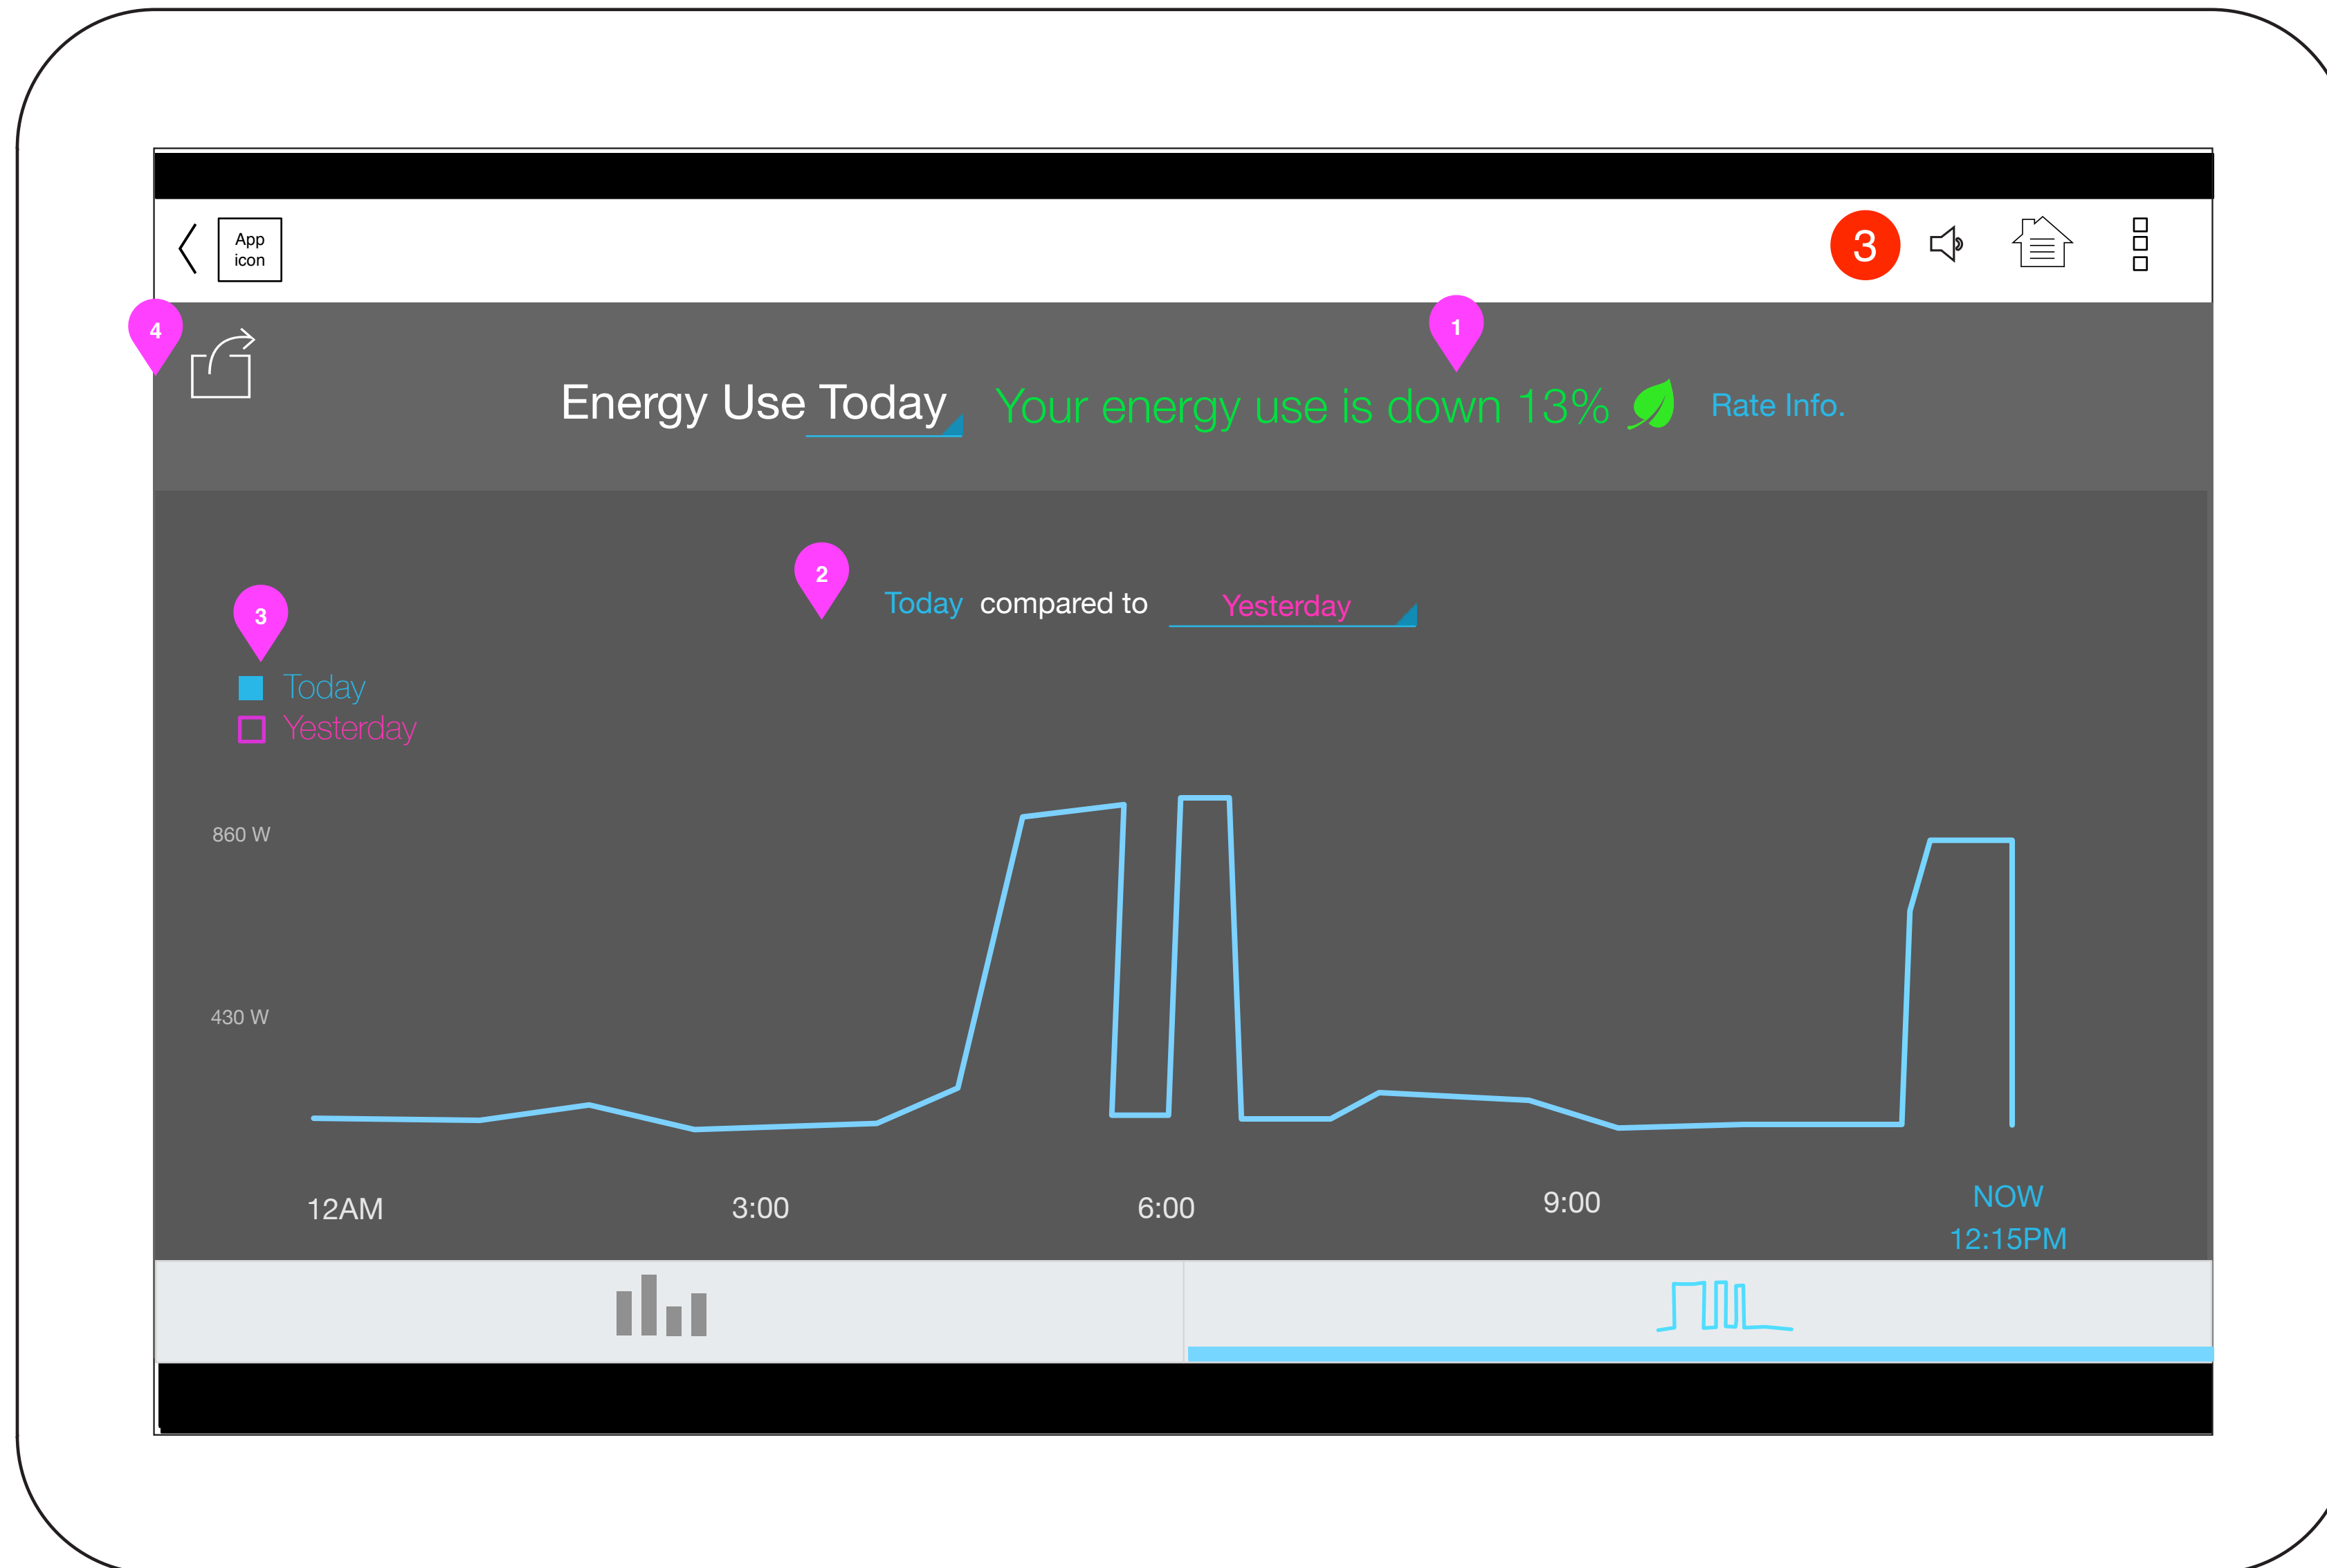

Dean Wong

Updating UI and flows per Andy, and removing all the Energy Fitness stuff from Phase 1

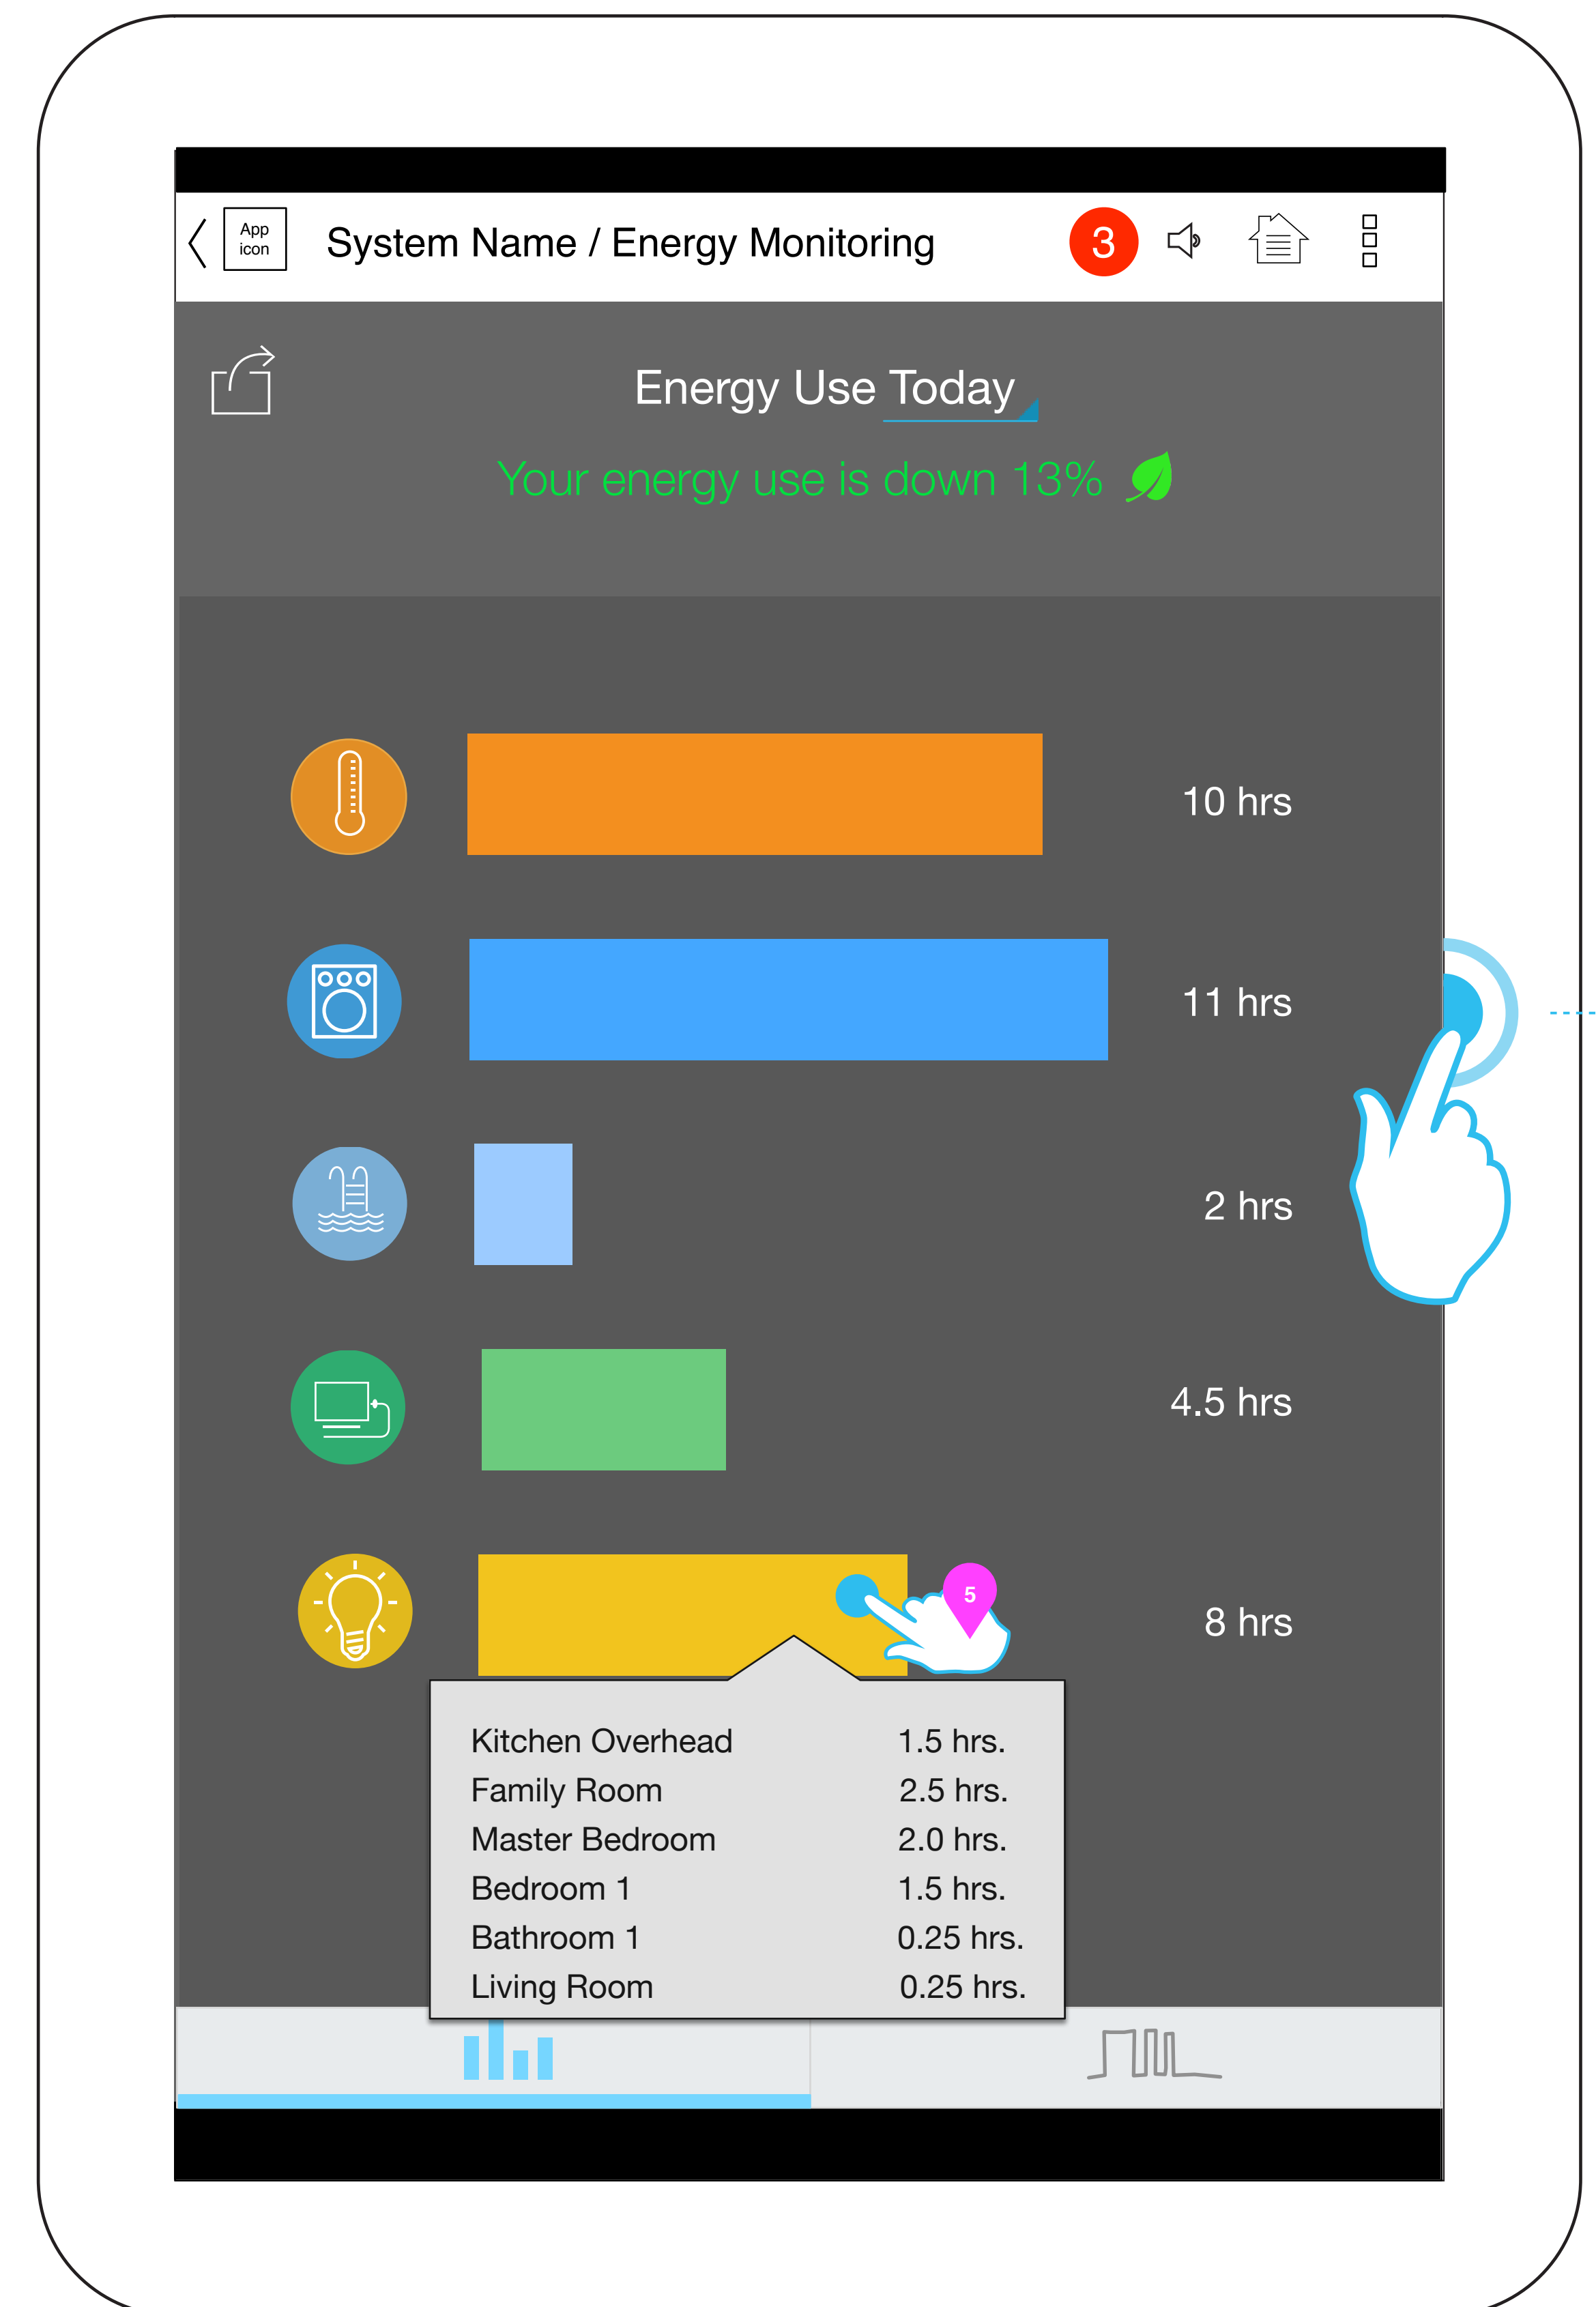

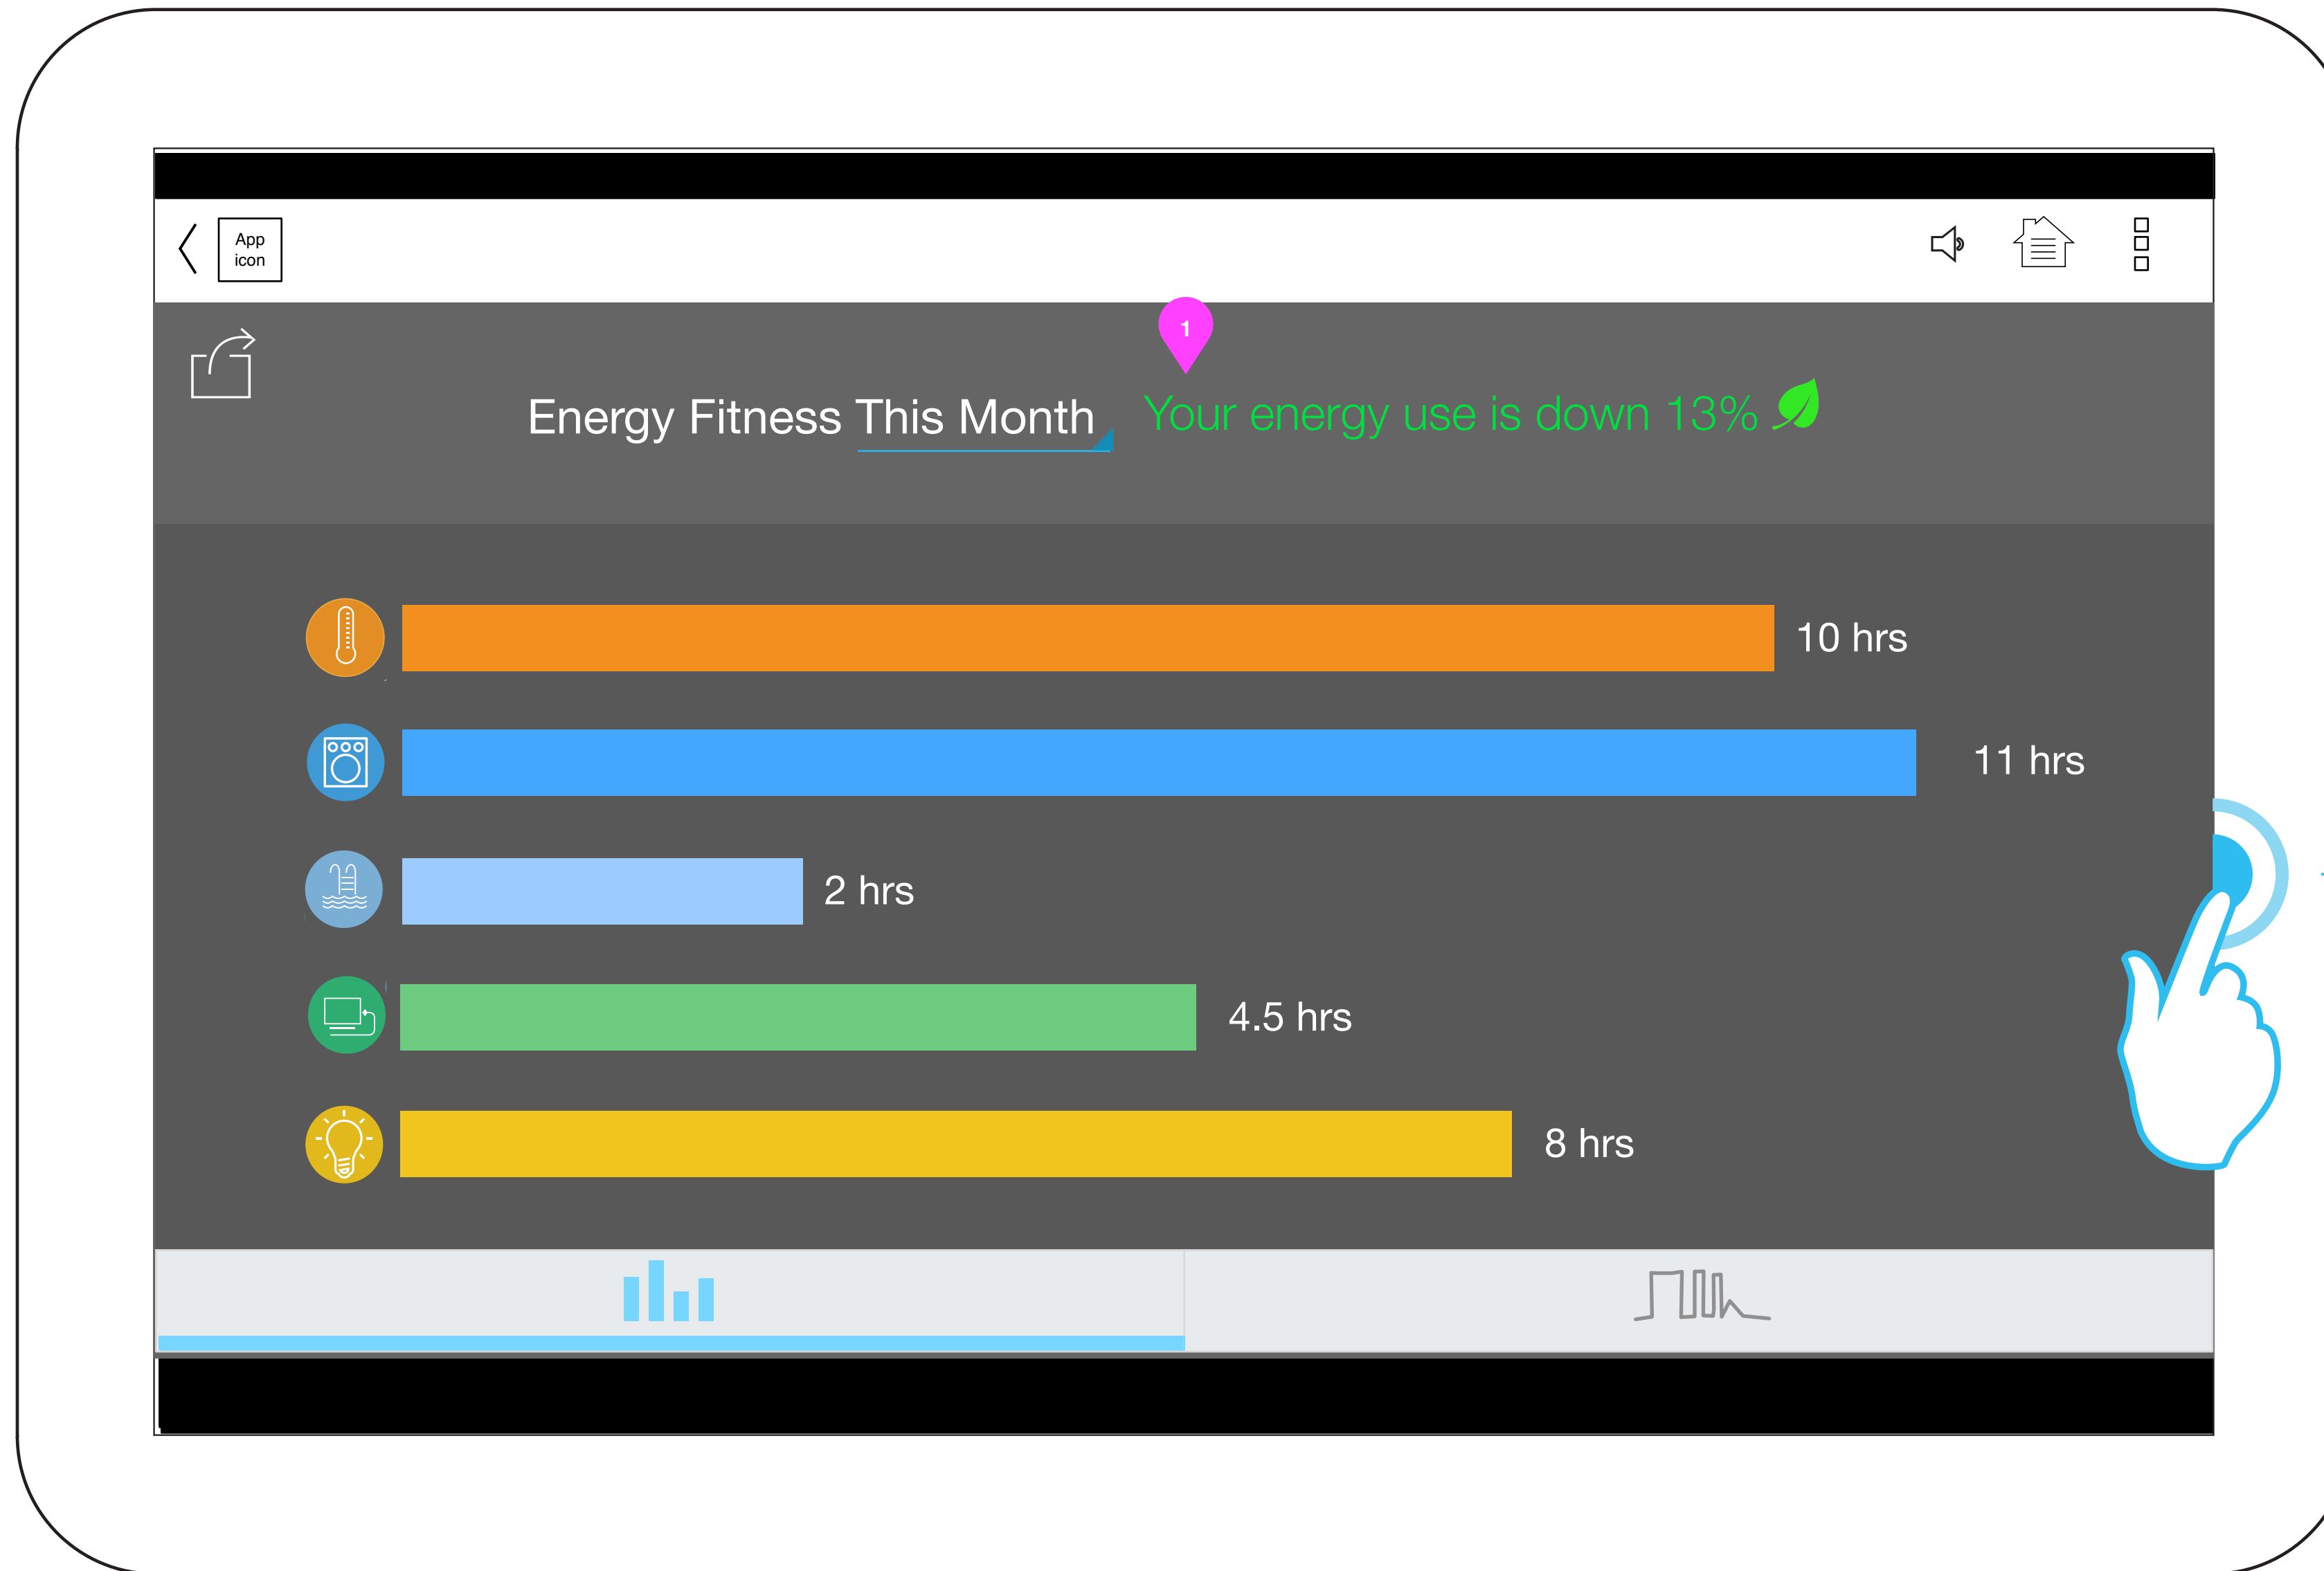

Monitoring in a “Today” state. Users can swap between a bar chart or line graph view by swiping or tabbing.

1. Notifications will be a global badge indicating new notifications and can be accessed here. Tapping the badge will bring the user to the notifications page.
2. “Energy Use” shown in a “Now” state will preface the time scoped: Today, This Week, This Month, This Year
3. The bar chart allows for a breakdown of total consumption to the time scoped above. The items in the chart are defined within the configuration / blueprint. Icons for popular groups must be applied in blueprint. The interactions in this chart are defined further within this document.
4. When Today: Single day picker, with ‘Yesterday’ at top
When This Week: Week picker with ‘Last Week’ at top
When This Month: Month picker with ‘<Name of Last Month>’ at top
When This Year: Year picker <Years>
5. Toggles off and on the history chart data for the compared time. Toggled on = Solid-fill, color-coded; Off = Stroked box.
6. Swipe right or left to view the bar chart or the line graph. Tab state toggles on/off to aid the user’s orientation.
7. Message that indicates where the user is trending or compared to against different dates.
8. While viewing ‘Day’ it will be indicated to the user the current time. The time scale up to the current time for the day will always fill the width of this area.
9. This energy scale will be dynamic and indicate 15% above the max value, and the midpoint to that number from zero.

1. "Energy Use" shown in a "Now" state for
2. Historical comparison selector.
3. Filtering to toggle on (solid fill) or off (outlined stroke) the corresponding line graph for that time designation.
4. Affordance to add this to a "dashboard" view as a widget.
5. Usage in layman's nomenclature (i.e. hours vs. kWh), and the ability to show more granular detail in-line about a particular service usage.

Usage over the course of a month. The user has selected 'This Month', which adjusts the filtered view.

- 1, Leaf icon is a positive indicator for the comparison being drawn by the filter settings.
2. The line graph comparison would give a tangible conversion, in this case \$\$\$ against kWh. In this line graph, there should be efforts to "smooth" the visualization of data so that it's easily understandable at-a-glance (In fact, the understanding is that the usage data in reality is actually more volatile/spikes quite a bit within a given time range like a week) The rate information will have to have been entered in Energy Monitoring Settings for this to appear.
3. Users can view their rate info. via a popup or, if the user hasn't entered it there's an affordance to do so here.
5. The timescale is adjusted to indicate days. Each Sunday (this month) is represented and weekends (Sunday to Sunday) should always be aligned by default to show the comparison in equal units of measure. Since weekends are typically where usage goes up.

If not comparing this time to the immediately previous time{

You used 15% more

1. In the Week view the chart should show the days and dates and Today. There should be some resolution to the energy use through days but it shouldn't attempt to apply all data points. Instead, the user should be able to obtain a 10k view of usage peaks and valleys for the week overall.
2. Energy Usage This Month indicates the total for energy use for each day. Again, the weekends should align by default Sunday to Sunday to best illustrate a direct 1:1 comparison.
3. Energy Usage This Year indicates the total for energy use for each month.

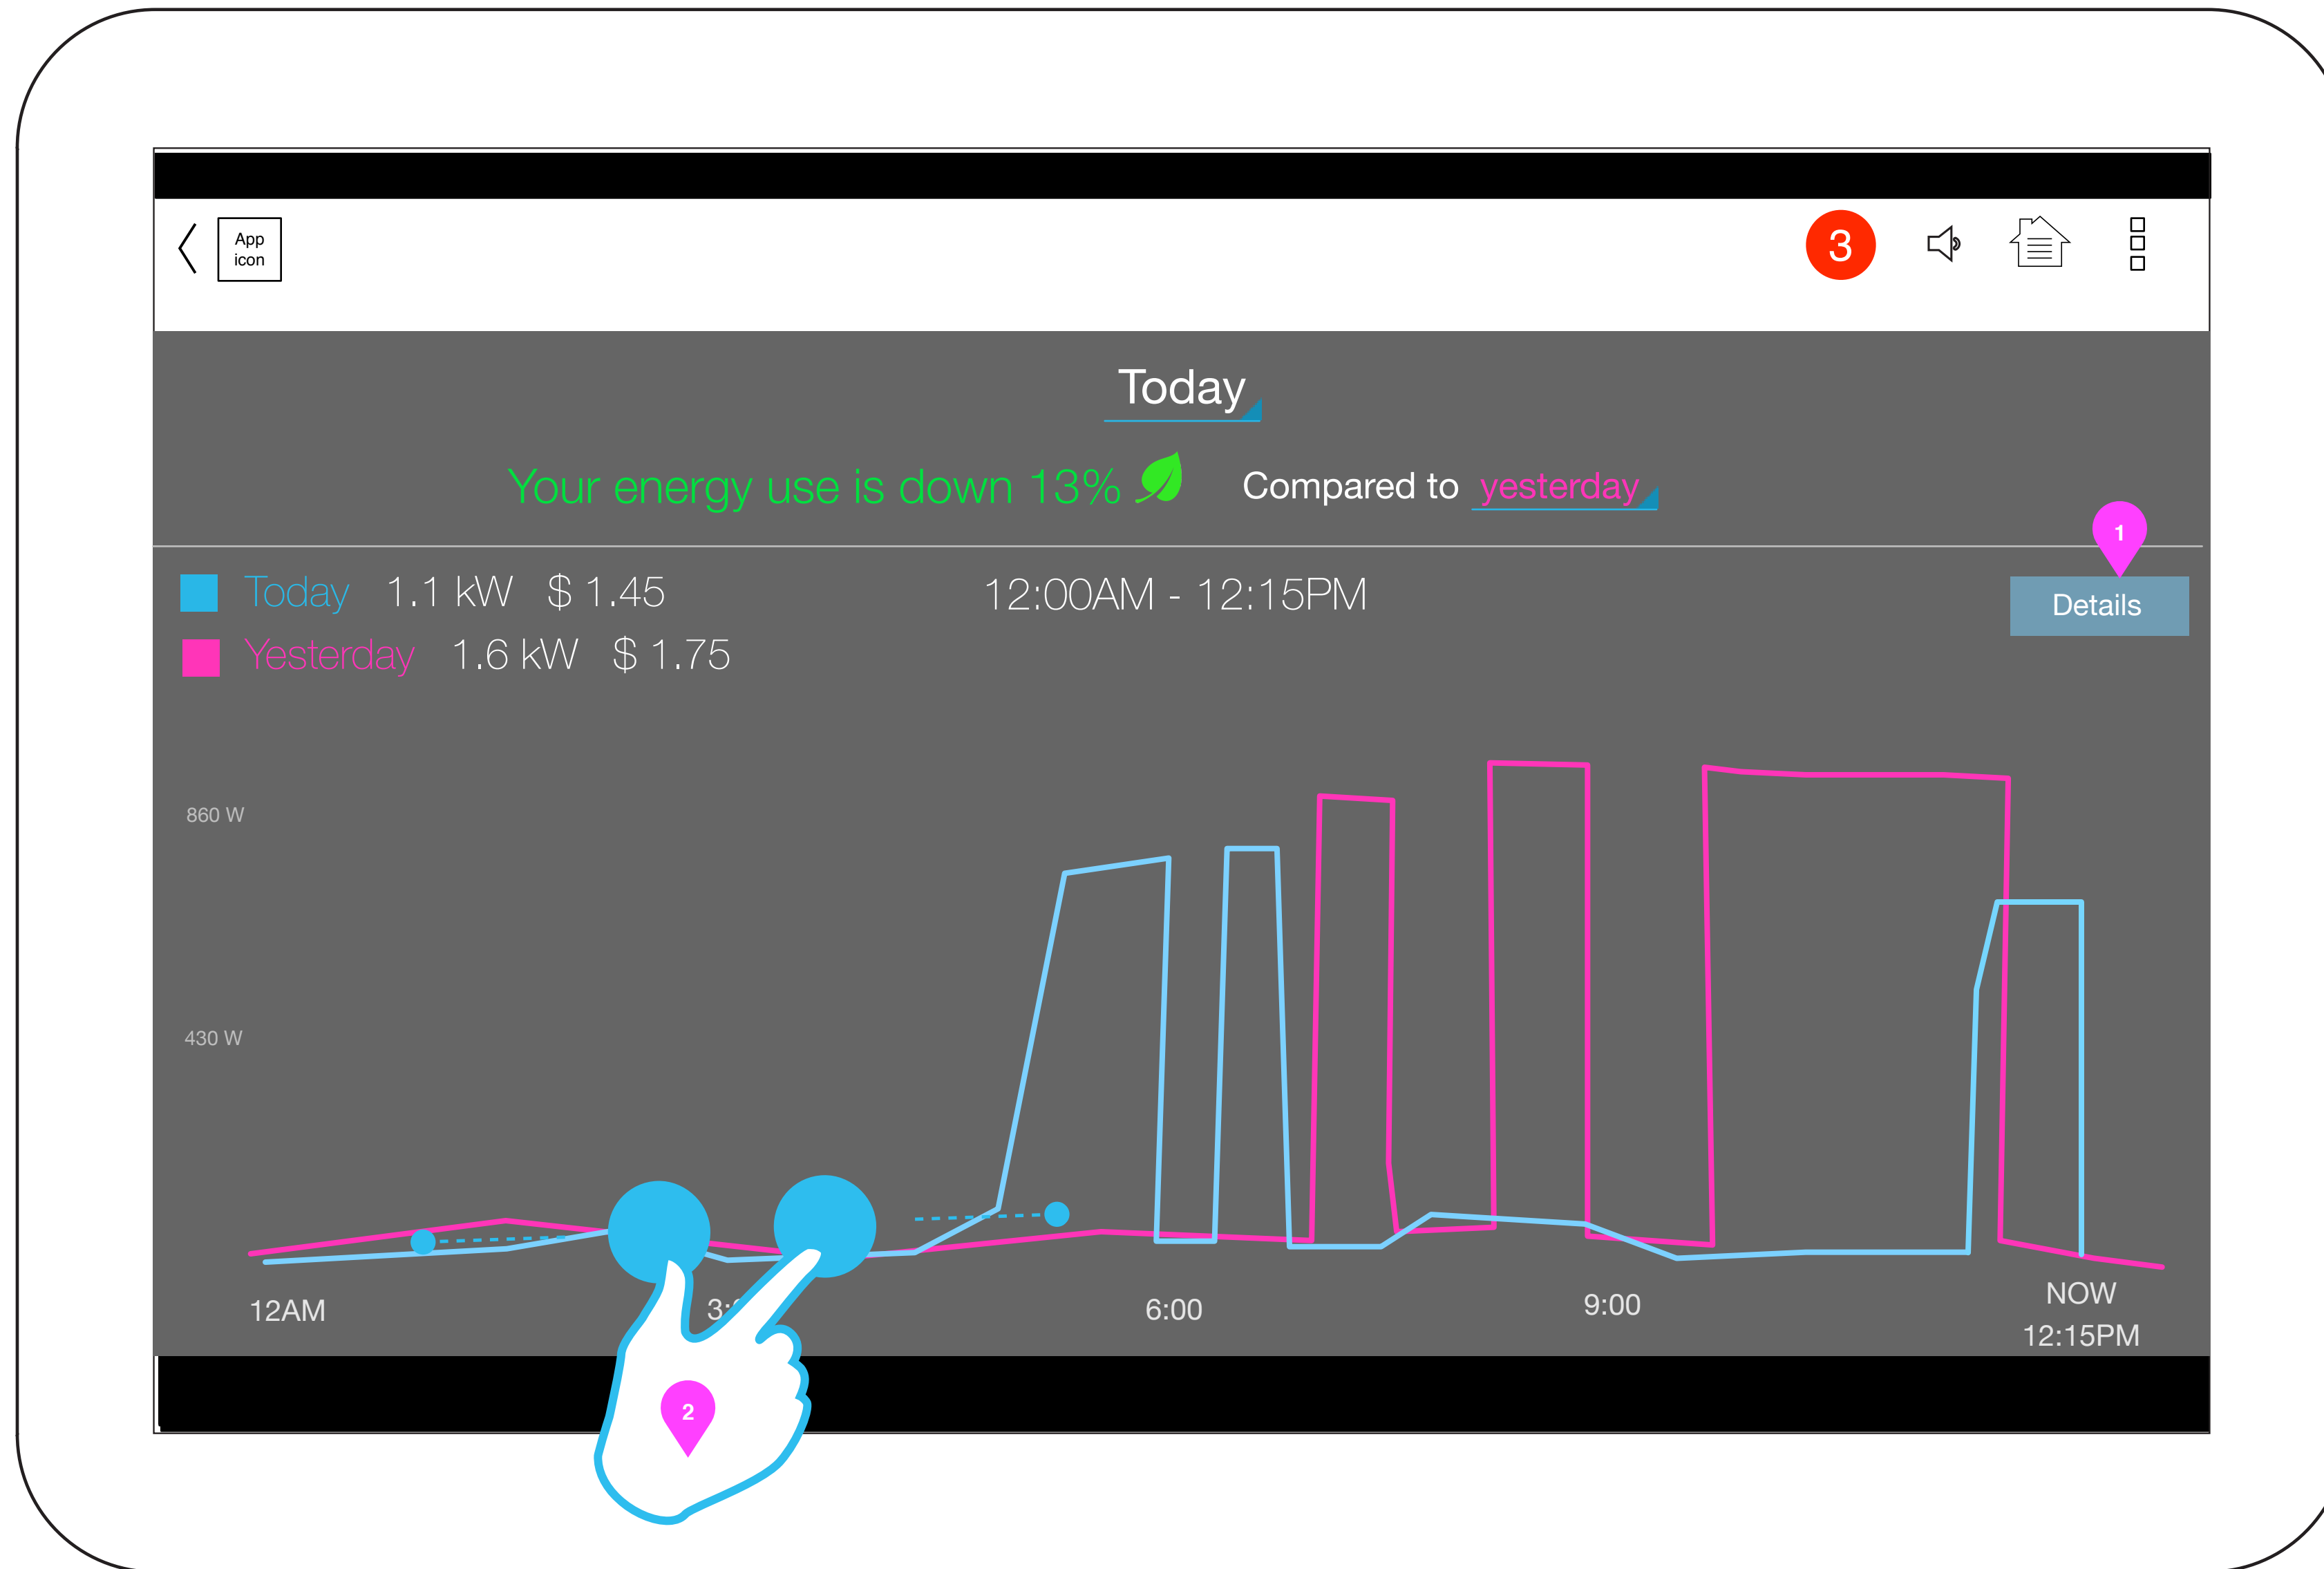

Nomenclature and colors for trending

4. When the compared time is not immediately previous to the current time, The nomenclature is 'You used X % compared to...'
5. When the compared time is not immediately previous to the current time, The nomenclature is 'You are trending, with arrows indicating whichever direction the trend is going.'
 - If energy consumption trends are going up (bad) the color is burnt orange. If going down (good), the color is green.
 - Pinch and zoom to expand the line chart. The panel on the left contracts elegantly towards the left margin but can be re-displayed as a two-pane view via a handle control.

If comparing this time to the immediately previous time{

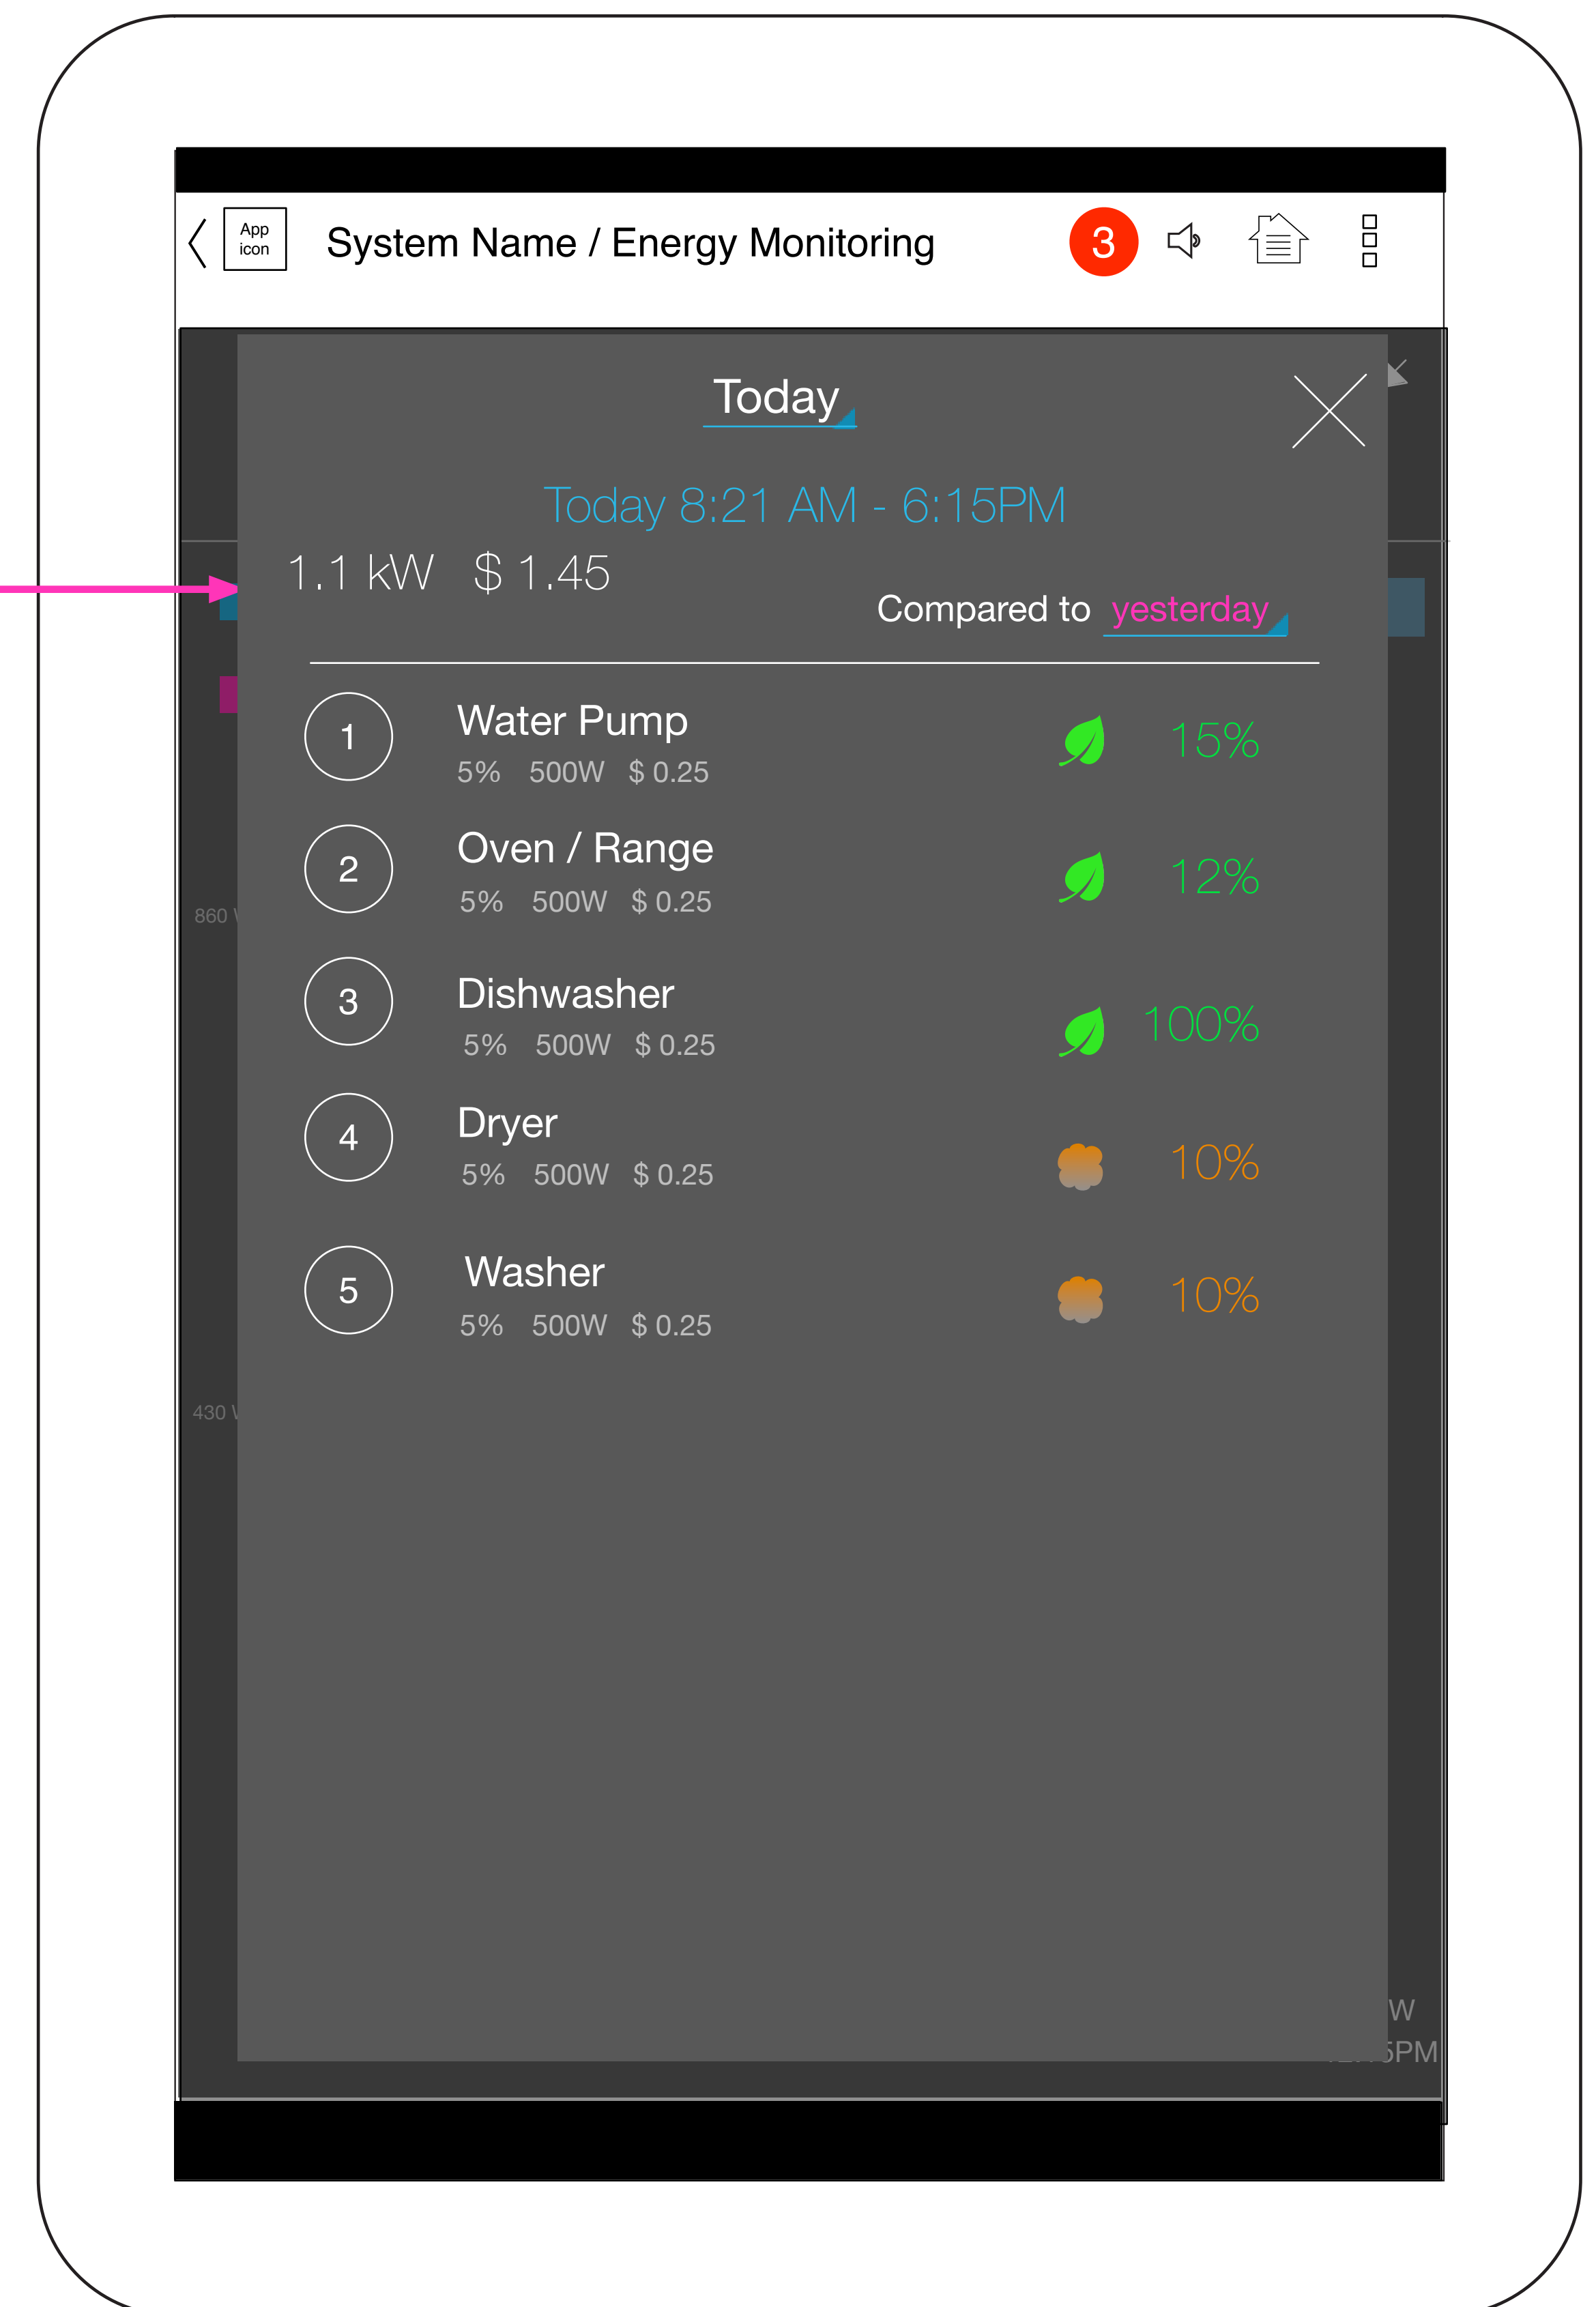

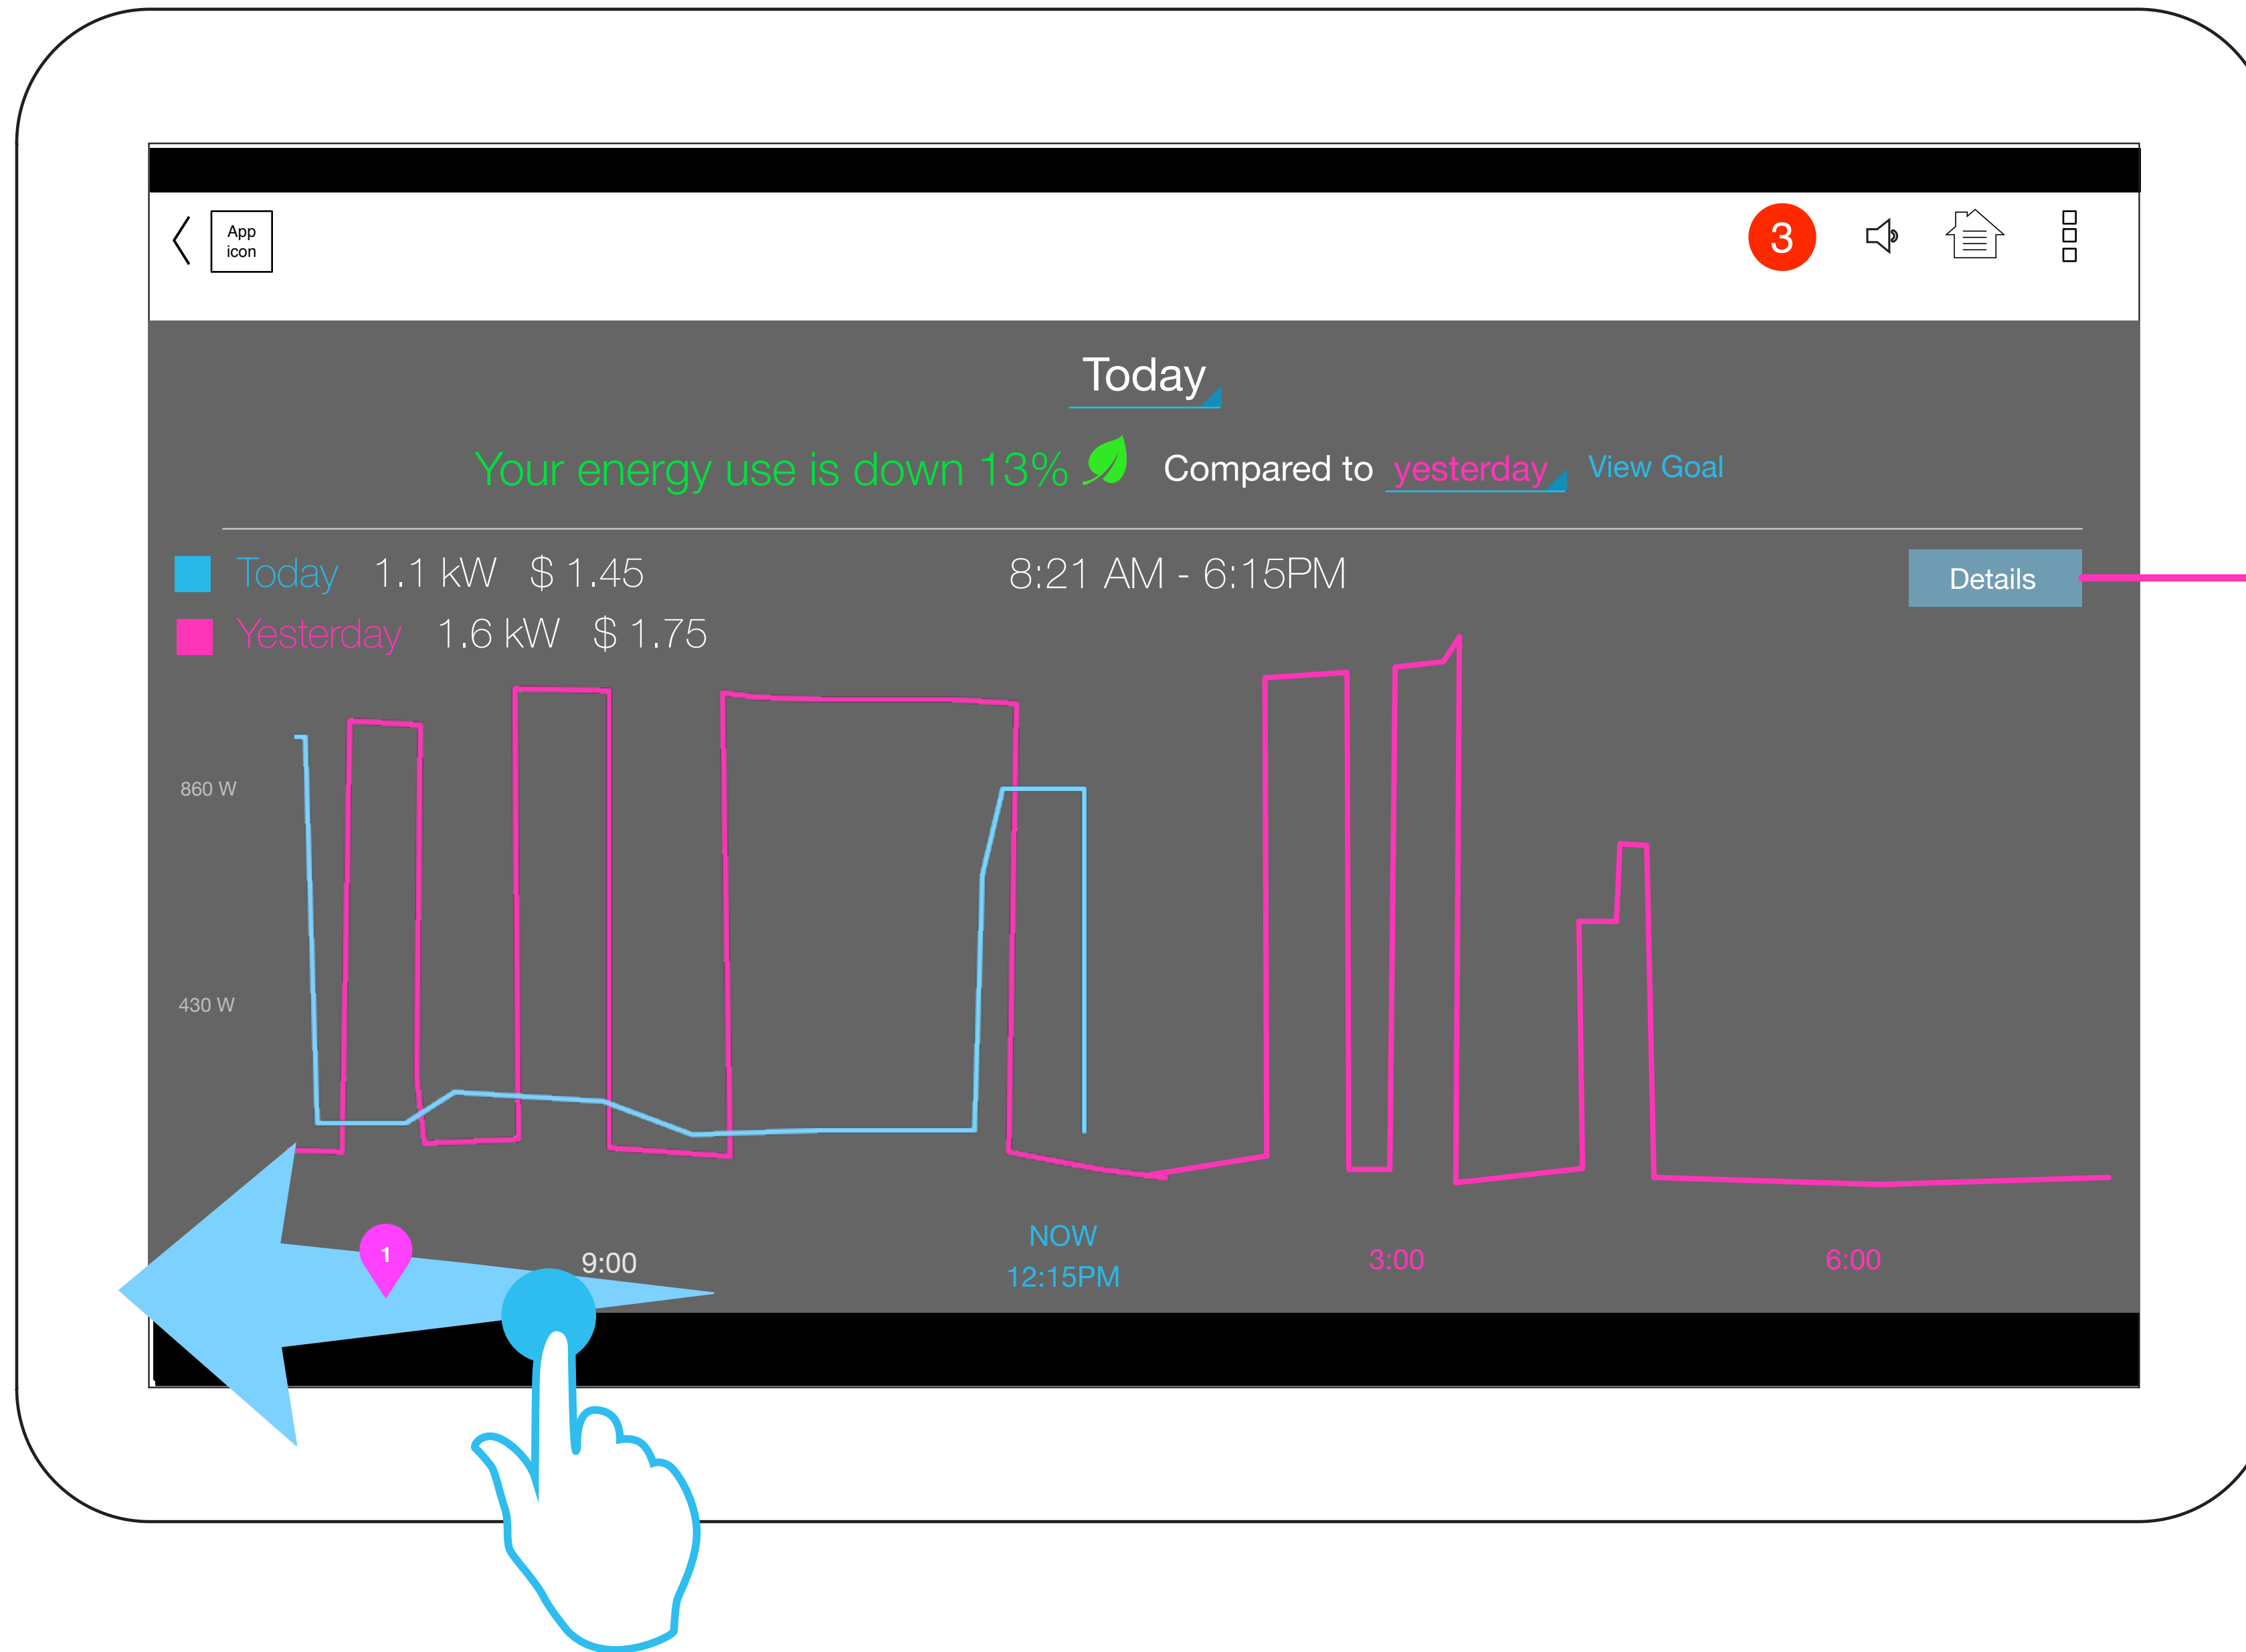

Your energy use is up 13%

A today view that shows two points in time as an overlay.

1. Details button opens a modal view to see usage by device.
2. Pinch and zoom to expand the line chart.

Navigating within time is done via a pinch and zoom to expand or contract the given time ranges that the user is interested in historically.

1. Pinch and zoom to expand or contract the line chart to a finer point in time. Swipe left or right horizontally to see an adjacent day or multi-hour block.
2. Clicking "Details" shows a line-item list view in a modal window. Users can see specific appliances' impact on their energy profile/efficiency.

Save Widget To Dashboard

Notifications Center with Energy Monitoring notifications as they might appear there...please refer to Project 1417 in Spacely for the latest wires.

1. Selecting the “Create Report” item will launch the “Report Creation” screen. This is where the user will define to whom and what notifications to send.
2. At the top of the screen the user will define the name of the report. The field will repopulate with a unique name.
3. The first column will show a list of users that can receive the notifications. Information pertaining to the user will populate the field. This list scrolls vertically.
4. Emails can be checked or unchecked for each user. This field will send an email to all the addresses checked.
5. At the top of the list, All check box allows the user to check all the All the email address for each of the users in the list.
6. The second column is a list of all the report options. This list scrolls vertically. Tapping on an item will check or uncheck it. Items that are checked will be included in the emailed report.
7. List of all Circuits or Groups including All.
8. Red
Yellow
Green
9. List of all Rooms including All
10. The third column the user picks what the frequency this report will be sent out.
